PLANNING FOR UNIT TESTS + DOCUMENTATION

1) Create a unit test for the login page:

- create an authentication test
  ↳ for successful login
  ↳ for unsuccessful login

  ↳ successful login : user = jhous0001
                       pw = password123

  should say successful login and grant the user access to the program.

  ↳ Unsuccessful login ; user = * wrong user *
                          pw = * wrong pw *

  should say unsuccessful login and will ask the user to enter details again.

1b) Documentation for authorisation / login page

- screenshot + annotate what the unit test is doing

- make sure that the screenshots are step by step
